Introduction to Web Programming

Lecture 13: Cookies

13.1: Cookie Basics

- 13.1: Cookie Basics
- 13.2: Programming with Cookies

Stateful client/server interaction

Sites like amazon.com seem to "know who I am." How do they do this? How does a client uniquely identify itself to a server, and how does the server provide specific content to each client?

- HTTP is a **stateless** protocol; it simply allows a browser to request a single document from a web server
- today we'll learn about pieces of data called cookies used to work around this
 problem, which are used as the basis of higher-level sessions between clients
 and servers

What is a cookie?

- **cookie**: a small amount of information sent by a server to a browser, and then sent back by the browser on future page requests
- · cookies have many uses:
 - authentication
 - user tracking
 - maintaining user preferences, shopping carts, etc.
- a cookie's data consists of a single name/value pair, sent in the header of the client's HTTP GET or POST request

How cookies are sent

- when the browser requests a page, the server may send back a cookie(s) with it
- if your server has previously sent any cookies to the browser, the browser will send them back on subsequent requests
- alternate model: client-side JavaScript code can set/get cookies

1. browser requests a Web page

2. server se

Cookie

Web browser

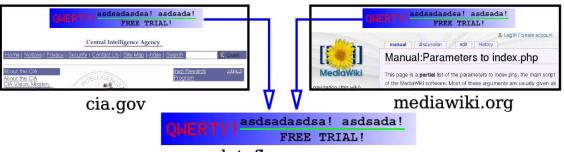

3. browser requests another page

Myths about cookies

- Myths:
 - Cookies are like worms/viruses and can erase data from the user's hard disk.
 - $\circ \;$ Cookies are a form of spyware and can steal your personal information.
 - Cookies generate popups and spam.
 - · Cookies are only used for advertising.
- Facts:
 - Cookies are only data, not program code.
 - Cookies cannot erase or read information from the user's computer.
 - Cookies are usually anonymous (do not contain personal information).
 - Cookies CAN be used to track your viewing habits on a particular site.

A "tracking cookie"

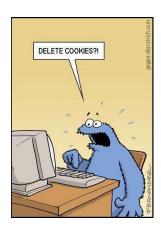

- lotofbanners.com
- an advertising company can put a cookie on your machine when you visit one site, and see it when you visit another site that also uses that advertising company
- therefore they can tell that the same person (you) visited both sites
- can be thwarted by telling your browser not to accept "third-party cookies"

Where are the cookies on my computer?

- IE: *HomeDirectory*\Cookies
 - e.g. C:\Documents and Settings\jsmith\Cookies
 - $\bullet\;$ each is stored as a . txt file similar to the site's domain name
- Chrome: C:\Users\username\AppData\Local\Google\Chrome\User Data\Default
- Firefox: *HomeDirectory*\.mozilla\firefox\???.default\cookies.txt
 - view cookies in Firefox preferences: Privacy, Show Cookies...

How long does a cookie exist?

- session cookie: the default type; a temporary cookie that is stored only in the browser's memory
 - when the browser is closed, temporary cookies will be erased
 - can not be used for tracking long-term information
 - safer, because no programs other than the browser can access them
- persistent cookie: one that is stored in a file on the browser's computer
 - can track long-term information
 - potentially less secure, because users (or programs they run) can open cookie files, see/change the cookie values, etc.

13.2: Programming with Cookies

- 13.1: Cookie Basics
- 13.2: Programming with Cookies

Setting a cookie in PHP

```
setcookie("name", "value");
setcookie("username", "martay");
setcookie("age", 19);
```

- setcookie causes your script to send a cookie to the user's browser
- setcookie must be called before any output statements (HTML blocks, print, or echo)
- you can set multiple cookies (20-50) per user, each up to 3-4K bytes
- by default, the cookie expires when browser is closed (a "session cookie")
- technically, a cookie is just part of an HTTP header, and it could be set using PHP's header function (but this is less convenient, so you would not want to do this):

```
header("Set-Cookie: username=martay; path=/; secure");
```

Retrieving information from a cookie

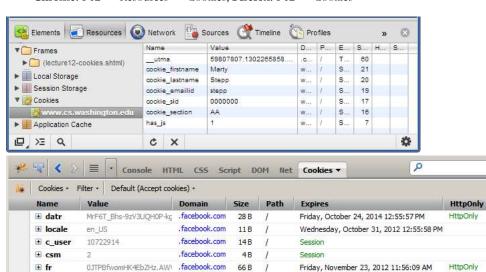

```
$variable = $_COOKIE["username"]; # retrieve value of the cookie

if (isset($_COOKIE["username"])) {
    $username = $_COOKIE["username"];
    print("Welcome back, $username.\n");
} else {
    print("Never heard of you.\n");
}
print("All cookies received:\n");
print_r($_COOKIE);
```

- any cookies sent by client are stored in \$_COOKIES associative array
- use isset function to see whether a given cookie name exists
- unset function deletes a cookie

What cookies have been set?

• Chrome: F12 → Resources → Cookies; Firefox: F12 → Cookies

26 B

Expiration / persistent cookies

RAcOrEAcnD-51qyc0CJhEr .facebook.com

⊞ lu

```
setcookie("name", "value", expiration);

$expireTime = time() + 60*60*24*7;  # 1 week from now
setcookie("CouponNumber", "389752", $expireTime);
setcookie("CouponValue", "100.00", $expireTime);
```

Friday, October 24, 2014 12:56:09 PM

HttpOnly

8 B 6 0

- to set a persistent cookie, pass a third parameter for when it should expire
- indicated as an integer representing a number of seconds, often relative to current timestamp
- if no expiration passed, cookie is a session cookie; expires when browser is closed
- time function returns the current time in seconds
 - date function can convert a time in seconds to a readable date

Deleting a cookie

setcookie("name", FALSE);
setcookie("CouponNumber", FALSE);

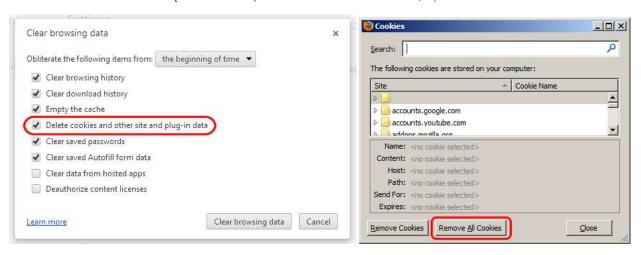

- setting the cookie to FALSE erases it
- you can also set the cookie but with an expiration that is before the present time:

```
setcookie("count", 42, time() - 1);
```

 remember that the cookie will also be deleted automatically when it expires, or can be deleted manually by the user by clearing their browser cookies

Clearing cookies in your browser

- Chrome: Wrench Chrome wrench icon → History → Clear all browsing data...
- Firefox: Firefox menu \rightarrow Options \rightarrow Privacy \rightarrow Show Cookies... \rightarrow Remove (All) Cookies

Cookie scope and attributes

```
setcookie("name", "value", expire, "path", "domain", secure, httponly);
```

- a given cookie is associated only with one particular domain (e.g. www. example. com)
- you can also specify a **path** URL to indicate that the cookie should only be sent on certain subsets of pages within that site (e.g. /users/accounts/ will bind to www. example. com/users/accounts)
- a cookie can be specified as **Secure** to indicate that it should only be sent when using HTTPS secure requests
- a cookie can be specified as **HTTP Only** to indicate that it should be sent by HTTP/HTTPS requests only (not JavaScript, Ajax, etc.; seen later); this is to help avoid JavaScript security attacks

Common cookie bugs

• When you call setcookie, the cookie will be available in \$_COOKIE on the *next* page load, but not the current one. If you need the value during the current page request, also store it in a variable:

```
setcookie("name", "joe");
print $_COOKIE["name"];  # undefined

$name = "joe";
setcookie("name", $name);
print $name;  # joe
```

• setcookie must be called before your code prints any output or HTML content:

```
<!DOCTYPE html><html>
<?php
setcookie("name", "joe");  # should precede HTML content!</pre>
```
