# **Introduction to Web Programming**

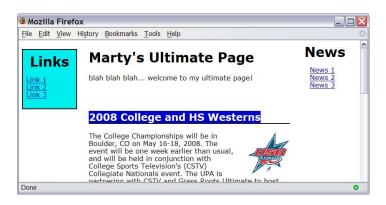

### Lecture 4: Page Sections and the CSS Box Model

### 4.1: Styling Page Sections

- 4.1: Styling Page Sections
- 4.2: Introduction to Layout

### **Motivation for page sections**

- want to be able to style individual elements, groups of elements, sections of text or of the page
- (later) want to create complex page layouts

#### The HTML id attribute

Spatula City! Spatula City!
Our mission is to provide the most
spectacular spatulas and splurge on our specials until our
customers <q>esplode</q> with splendor!

Spatula City! Spatula City!

Our mission is to provide the most spectacular spatulas and splurge on our specials until our customers "esplode" with splendor!

- allows you to give a unique ID to any element on a page
- each ID must be unique; can only be used once in the page

### Linking to sections of a web page

```
Visit <a href=
    "http://www.textpad.com/download/index.html#downloads">
    textpad.com</a> to get the TextPad editor.
<a href="#mission">View our Mission Statement</a>

Visit <a href="#mission">textpad.com</a> to get the TextPad editor.
View our Mission Statement
```

- a link target can include an ID at the end, preceded by a #
- browser will load that page and scroll to element with given ID

#### **CSS ID selectors**

```
#mission {
   font-style: italic;
   font-family: "Garamond", "Century Gothic", serif;
}

Spatula City! Spatula City!

Our mission is to provide the most spectacular spatulas and splurge on our specials until our customers "esplode" with splendor!
```

- applies style only to the paragraph that has the ID of mission
- element can be specified explicitly: p#mission {

#### The HTML class attribute

```
class="shout">Spatula City! Spatula City!

class="special">See our spectacular spatula specials!

class="special">Today only: satisfaction guaranteed.

Spatula City! Spatula City!
See our spectacular spatula specials!
Today only: satisfaction guaranteed.
```

- classes are a way to group some elements and give a style to only that group ("I don't want ALL paragraphs to be yellow, just these three...")
- unlike an id, a class can be reused as much as you like on the page

#### **CSS class selectors**

• applies rule to any element with class special, or a p with class shout

### **Multiple classes**

```
<h2 class="shout">Spatula City! Spatula City!</h2>
See our spectacular spatula specials!
Satisfaction guaranteed.
We'll beat any advertised price!
</pr>
Spatula City! Spatula City!
See our spectacular spatula specials!
Satisfaction guaranteed.
We'll beat any advertised price!
```

• an element can be a member of multiple classes (separated by spaces)

### **CSS** for following examples

```
.special {
  background-color: yellow;
  font-weight: bold;
}
.shout {
  color: red;
  font-family: cursive;
}
```

• for the next several slides, assume that the above CSS rules are defined

### Sections of a page: <div>

a section or division of your HTML page (block)

- a tag used to indicate a logical section or area of a page
- has no appearance by default, but you can apply styles to it

### Inline sections: <span>

an inline element used purely as a range for applying styles

```
<h2>Spatula City! Spatula City!</h2>
See our <span class="special">special">spectacular</span> spatula specials!
We'll beat <span class="shout">any advertised price</span>!
Spatula City! Spatula City!
See our spectacular spatula specials!
We'll beat any advertised price!
```

• has no onscreen appearance, but you can apply a style or ID to it, which will be applied to the text inside the span

#### **CSS** context selectors

```
selector1 selector2 {
    properties
}
```

• applies the given properties to **selector2** only if it is inside a **selector1** on the page

```
selector1 > selector2 {
    properties
}
```

• applies the given properties to **selector2** only if it is *directly* inside a **selector1** on the page (**selector2** tag is immediately inside **selector1** with no tags in between)

# **Context selector example**

```
Shop at <strong>Hardwick's Hardware</strong>...

(li) The <strong>best</strong> prices in town!
(li) Act while supplies last!
(/ul)

Ii strong { text-decoration: underline; }
Shop at Hardwick's Hardware...

The best prices in town!
Act while supplies last!
```

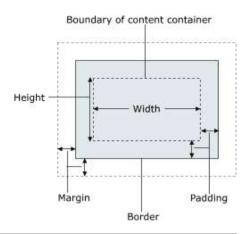

### More complex example

### 4.2: Introduction to Layout

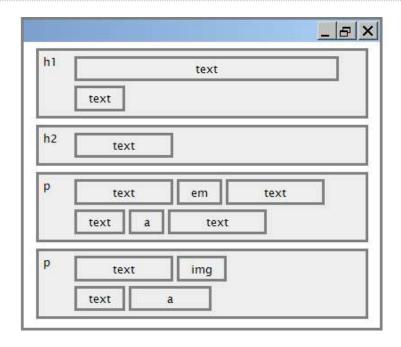

- 4.1: Styling Page Sections
- 4.2: Introduction to Layout

### The CSS Box Model

- for layout purposes, every element is composed of:
  - the actual element's **content**
  - a **border** around the element
  - **padding** between the content and the border (*inside*)
  - a margin between the border and other content (outside)
- width = content width + L/R padding + L/R border + L/R margin
   height = content height + T/B padding + T/B border + T/B margin

### **Document flow - block and inline elements**

# **CSS** properties for borders

h2 { border: 5px solid red; }
This is a heading.

property	description
border	thickness/style/color of border on all 4 sides

- thickness (specified in px, pt, em, or thin, medium, thick)
  style (none, hidden, dotted, dashed, double, groove, inset, outset, ridge, solid
- color (specified as seen previously for text and background colors)

# **More border properties**

property	description	
border-color, border-width, border-style	specific properties of border on all 4 sides	
border-bottom, border-left, border-right, border-top	all properties of border on a particular side	
border-bottom-color, border-bottom-style, border-bottom-width, border-left-color, border-left-style, border-left-width, border-right-color, border-right-style, border-right-width, border-top-color, border-top-style, border-top-width	properties of border on a particular side	
Complete list of border properties		

### **Border example 2**

```
h2 {
   border-left: thick dotted #CC0088;
   border-bottom-color: rgb(0, 128, 128);
   border-bottom-style: double;
}
This is a heading.
```

- each side's border properties can be set individually
- if you omit some properties, they receive default values (e.g. border-bottom-width above)

#### Rounded corners with border-radius 5

```
p {
  border: 3px solid blue;
  border-radius: 12px;
  padding: 0.5em;
}

This is a paragraph.

This is another paragraph.
  It spans multiple lines.
```

• each side's border radius can be set individually, separated by spaces

# **CSS** properties for padding

property	description	
padding	padding on all 4 sides	
padding-bottom	padding on bottom side only	
padding-left	padding on left side only	
padding-right	padding on right side only	
padding-top	padding on top side only	
Complete list of padding properties		

# **Padding example 1**

```
p { padding: 20px; border: 3px solid black; }
h2 { padding: 0px; background-color: yellow; }
```

This is the first paragraph

This is the second paragraph

This is a heading

# **Padding example 2**

```
p {
    padding-left: 200px; padding-top: 30px;
    background-color: fuchsia;
}

This is the first paragraph

This is the second paragraph
```

- each side's padding can be set individually
- notice that padding shares the background color of the element

### **CSS** properties for margins

property	description	
margin	margin on all 4 sides	
margin-bottom	margin on bottom side only	
margin-left	margin on left side only	
margin-right	margin on right side only	
margin-top	margin on top side only	
Complete list of margin properties		

# Margin example 1

```
p {
    margin: 50px;
    background-color: fuchsia;
}

This is the first paragraph

This is the second paragraph
```

• notice that margins are always transparent (they don't contain the element's background color, etc.)

### Margin example 2

```
p {
    margin-left: 8em;
    background-color: fuchsia;
}

This is the first paragraph
This is the second paragraph
```

• each side's margin can be set individually

### **CSS** properties for dimensions

```
p { width: 350px; background-color: yellow; }
h2 { width: 50%; background-color: aqua; }

This paragraph uses the first style above.

An h2 heading
```

property	description
width, height	how wide or tall to make this element (block elements only)
max-width, max-height, min-width, min-height	max/min size of this element in given dimension

### Centering a block element: auto margins

```
margin-left: auto;
margin-right: auto;
width: 750px;

Lorem ipsum dolor sit amet, consectetur adipisicing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua.
```

- works best if width is set (otherwise, may occupy entire width of page)
- to center inline elements within a block element, use text-align: center;
